

## Automate a purchase operation

In this test, you will automate a complete purchase operation on an e-commerce website. The script should be reliable i.e. it runs multiple times without breaking randomly.

Please provide documentation to set up and running your tests. We recommend you to use Selenium Webdriver and JavaScript (Node.js) but feel free to use any framework or language familiar to you, including non-Selenium tools such as Cypress and Puppeteer.

Some requirements are intentionally left vague. If a requirement is not given, use your best judgment to decide how and what should be checked. If still in doubt, feel free to ask us for clarification. In the documentation, please document any decisions you've made so we can better understand why you've made them.

You can take the time you need to implement the solution but please, inform us of how long you need to send us the result. As soon as you send us the result, we will analyze the test result and provide you with some feedback. Following up, we will schedule a meeting where you will be able to present your solution, explain your design decisions, and discuss it with us.

### Test description

Go to <http://practice.automationtesting.in>, add a book to the cart, proceed to checkout and complete the operation until you reach the order confirmation page ('Order Details'). Add all the assertions you see fit and generate a test report with the test results.

If you have any questions, please feel free to reach out to us.

Good luck!
